THE goldenhour

Research shows that what happens in the first, crucial hour of a premature baby's life can make a difference between a good outcome and a poor outcome or, the worst scenario of all, death. By focusing on the key stages of thermoregulation, resuscitation, administration of antibiotics and parenteral nutrition, hypoglycaemia management and admission into the NICU, the risks of morbidity and mortality decrease¹. For some high-risk babies, these key interventions can last for hours, or even days.

Recognising the importance of the 'Golden Hour' principles, along with improvements in medicine and more effective technology, means that survival rates are increasing.

In our mission to value life, we have worked with neonatologists for over a decade focusing on the moments after birth, thermoregulation, respiratory support, cardiovascular support and protection. Our aim is to offer clinicians the products that give their youngest, and most vulnerable patients the best possible start in life.

A STERILE HEAT LOSS PREVENTION SUIT TO DELIVER LIFE-SAVING THERMAL CARE

Immediately after a premature baby is delivered by c-section, the priority is to place them in a warm and sterile environment. neohelp™ provides this essential protection so other essential Golden Hour care and treatment, including delayed cord clamping, can take place.^(2,3)

Integrated adjustable hood

Decreases heat loss through radiation:

- More efficient than a stockinette cap allowing air to pass through the material
- The toggle allows you to adjust to the baby's head.

Double layer of soft clear polyethylene

Decreases heat loss through convection and evaporation:

- Creates a warm and humid environment, mimicking the incubator effect
- The thin inner allows for excellent skin contact
- Creates a barrier against drafts
- Allows passage of radiant heat from an additional warming device (if used)⁴
- Transparent material allows vital observations⁵.

Pre-shaped foam support

Decreases heat loss through conduction:

- Helps to maintain an open airway by raising the shoulders
- Stabilises the baby's position
- Provides thermal care during transportation
- Provides comfort.

Central VELCRO® opening

Provides optimum seal to ensure heat conservation:

- Quick and easy to place around the baby
- Allows full access to the baby's body
- Designed for easy placement of monitoring equipment, IV, umbilical catheters and carrying out Golden Hour care.

Scan to watch our video

on using neohelp™ to assist during delayed cord clamping.

Please note: The link will take you to an external website

Why is thermal care important?

Thermal care is vital for a preterm infant because they may have unbalanced skin-surface to weight ratio, very little or no capacity to generate heat (brown adipose tissue), inadequate stores of subcutaneous (insulating) fat and immature epidermal barrier^{5,6}.

At this vital time, **neohelp™** prevents heat loss through its double layer of soft, clear polyethylene, integrated adjustable hood and **VELCRO®** seal.

For every 1°C decrease:

Risk of sepsis increases **by 11%**
Risk of death increases **by 28%**⁴

In the first 10-20 minutes,

without any protection,
temperature can fall **by 2-4°C**⁷

Why is delayed cord clamping important?

Provided the baby can be kept warm and does not need immediate resuscitation, the Resuscitation Council UK (RCUK) recommends delayed cord clamping (DCC) for at least 60 seconds whilst breathing is established⁸.

Delayed cord clamping has been shown to reduce the relative risk of:

- Intraventricular haemorrhage by 41% (RR 0.59, 95% CI 0.41 to 0.85)⁹
- Necrotising enterocolitis by 38% (RR 0.62, 95% CI 0.43 to 0.90)⁹.

In addition, this procedure increases circulation of blood volume after birth and an improvement in cardiovascular stability, reducing the need for a blood transfusion.

surfcath®

A CATHETER FOR SURFACTANT ADMINISTRATION USING THE LISA TECHNIQUE

For babies needing treatment for respiratory distress syndrome (RDS), surfcath™ uses the LISA (Less Invasive Surfactant Administration) technique to place the catheter. Specifically designed to improve manoeuvrability during placement whilst also eliminating the need for the commonly used Magill forceps.

2cm soft distal black tip

- 2cm mark shows when surfcath™ is in place
- Soft tip minimises risk of tracheal lesions and prevents kinking
- Pre-curved to follow the airway anatomy.

Transparent bendable thermoplastic material

- Transparent material allows visual check on the delivery of surfactant
- Thermosensitive material allows you to curve surfcath™ prior to use meaning no need for Magill forceps
- Semi-rigid material also allows high manoeuvrability, helping to follow the airway anatomy.

Less invasive 6Fr gauge

- No obstruction of the airways allowing spontaneous breathing
- Low dead space (0.2mL).

20cm length with cm markings

- Longer length eases manipulation of the surfactant syringe away from the patient's head
- Centimetre markings indicate the inserted length and check that surfcath™ stays in place.

Treating respiratory distress syndrome (RDS)

RDS is the most common lung disease in premature infants and is a pulmonary disorder resulting from a surfactant deficiency. In Europe RDS is observed for about 90% of babies born at 24 weeks and for 80% babies born at 28 weeks of gestation¹⁰.

International guidelines recommend

- Preterm infants should be managed without mechanical ventilation where possible
- Continuous positive airway pressure (CPAP) with early rescue surfactant is considered optimal management for babies with RDS
- LISA is the preferred mode of surfactant administration for spontaneously breathing babies on CPAP, provided that clinicians are experienced with this technique¹⁰.

expert umbilical catheter

SINGLE AND DOUBLE UMBILICAL CATHETERS WITH ANTIMICROBIAL TECHNOLOGY

The *expert* umbilical catheter is the only umbilical catheter with integrated antimicrobial AgION™ technology, to fight against CRBSI in NICUs.

Ag⁺ is a bacteriostatic that inhibits the cell reproduction. Ag⁺ combines with bacterial proteins located in the cell wall and cytoplasm which interferes with their normal functioning.

These proteins are vital for the healthy functioning of the cell, therefore loss of the proteins results in the death of the bacteria.

Clinical performances

“A reduction in catheter-related bloodstream infections in preterm infants found from using catheters with the AgION™ antimicrobial system¹¹.”

“Preterms with an expert umbilical venous catheter had shorter hospital stays and a lower case fatality rate¹¹.”

“There was no case of intolerance to the AgION™ catheters and none of these catheters had to be removed due to a local skin infection. In addition, none of the patients in the AgION™ catheter group showed signs of silver toxicity¹¹.”

Umbilical catheters

TRIPLE LUMEN UMBILICAL CATHETER

A triple lumen umbilical catheter to administer TPN and for the injection of drugs, particularly those with incompatible features or when one drug needs to be injected continually.

Umbilical placement pack

OUR UMBILICAL PLACEMENT PACK CONTAINS EVERYTHING REQUIRED TO SAFELY & EFFICIENTLY PLACE AN UMBILICAL CATHETER

The benefits of our umbilical packs

Cost saving

A complete pack costs less than buying the individual components.

Delivers better patient care

Pack enables Aseptic Non-Touch Technique for catheter placement to minimise infections. Also allows traceability of pack components used.

Reinforces best practice

Pack includes a heat-sealed drape (to maximise the sterile barrier) and a safety hypodermic needle (to minimise the risk of accidental needlestick injuries).

Standardises procedures

Consistent clinical practice assured with identical pack contents.

More environmentally friendly

Less waste with a pack compared to multiple packaging of individual components.

Each pack contains

	18G hypodermic safety needle		20G hypodermic safety needle		Scalpel
	Drapes without adhesive		40x40cm fenestrated transparent drape with "Easy-peel"		Drape towels
	1 x pair of suture scissors		10 x swabs 10x10cm, 8-ply		10 x swabs 5x5cm, 8-ply
	1 x transparent gallipot 60mL		1 x red gallipot 60mL		Outer wrap
	Instructions for use		Umbilical tape		Measuring guide
	Mosquito haemostat curved		Mosquito haemostat straight		Iris forceps full curved
	Iris forceps half curve		Iris forceps straight		Iris forceps straight with teeth
	Needle holder		Measuring tape		1 mL syringe
	3mL syringe		5mL syringe		Vessel dilator probe
	3.0 silk suture with curved cutting needle		Tray 20 x 15x4cm		2 x fixation strips

We can customise procedure packs to suit your requirements.

A DEDICATED INTRODUCER KIT FOR THE PLACEMENT OF NEONATAL LONGLINES IN SMALL VEINS

microsite® gives clinicians access to the smallest of veins using their preferred introducer whilst eliminating the need to leave it attached to the line.

Puncture needle

24G needle

- Ideal for small veins and minimising trauma.

Transparent hub

- Gives a clear immediate view of blood flashback.

Funnel entry

- Allows easy insertion of the guidewire.

Guidewire

Symmetrical tips

- The guidewire can be used either side.

Black markings

- Correspond to the length of the 24G puncture needle.

Nitinol

- Minimises the risk of kinking.

Flexible tip

- Atraumatic to vein endothelium
- 0.3mm ball head.

Dilator & cannula

Tapered tip

- Provides good skin penetration and smooth dilation.

Peelable sheath

- For easy post insertion removal.

Funnel entry

- Easy insertion of a catheter up to 2Fr.

Guidewire insertion aid

Funnel entry

- Eases the insertion of the dilator sheath over the guidewire.

Scan to watch our video

on the microsite® introducer kit in use

Please note: The link will take you to an external website

Gaining safe and effective vascular access can be essential for premature babies who require total parenteral nutrition, fluids, or drugs. But it can be a difficult procedure and traumatic for patients. Evidence shows that exposure to pain from needle tips and IVs can be stressful for babies. microsite® can help avoid patient distress by enabling more accurate, first time venous access and therefore reducing unnecessary repeat access attempts. This, in turn, preserves delicate veins. The benefits of microsite® include:

- Facilitating easy peripheral venous access¹²
- Enhancing the rate of successful placement¹³
- Allowing 1Fr and 2Fr central venous catheters to be safely placed in peripheral veins¹⁴

Instructions for use

Puncture vein with 24G needle

Insert guidewire through needle

Withdraw needle leaving guidewire in place

Insert cannula into guidewire insertion aid

Thread insertion aid and cannula over guidewire

Hold guidewire and remove insertion aid

Insert sheath dilator into vein

Remove dilator and guidewire

Insert catheter then remove and split peelable sheath

premi**cath**®

A 1Fr PICC LINE DESIGNED SPECIALLY FOR NEWBORNS UNDER 1KG

Infants born prematurely weighing under 1kg often need the nutritional and therapeutic support that can only be delivered into their tiny vessels via venous access. At just 1Fr, premi**cath**® has been specially designed for the smallest and most fragile babies to deliver optimum accuracy during placement as well as minimising trauma for patients.
